Introduction

Floods are the most frequently occurring disaster on the planet, and a growing number of financial tools, techniques and systems are emerging to address this reality. Watershed-oriented flood management is a relatively new approach, and the Louisiana Watershed Initiative is at the forefront of efforts by several states to adopt similar methods.

Because watershed and flood risk management involve complex systems, best practices for long-term funding inevitably require multiple sources and a mix of mechanisms and organizations to receive and manage funds. As an examination of funding mechanisms, this paper aims to introduce the reader to new strategies to consider in developing funding strategies. Some of these strategies are familiar, some new to Louisiana; all have potential to generate substantial revenue streams.

Our success in designing and funding policies and programs necessary for effective watershed-based solutions will determine the fate of current and future generations living in Louisiana.

Funding Fundamentals

Funds arise from two sources: public and private. Public funds include general budget outlays, grants and distribution of revenue from taxes, fees and penalties, as well as from debt-obligation mechanisms such as bonds and loans. Private sources include philanthropy, donations and public-private partnership models.

The range of public funding mechanisms supporting watershed management includes:

- Stormwater fees and other fee structures
- Bonds including general obligation, revenue and green bonds
- General budget outlays and capital outlays
- Federal and state grants
- Carbon and resource pricing/trading systems

Private and nongovernmental funding mechanisms include:

- Philanthropy
- Public-private partnerships
- Land trusts
- Remediation projects
- Bonds

See Suggested Readings for a list of funding guides and resources.
Methodology and Findings

Methodology and Findings

Watershed-oriented and flood risk reduction funding strategies were evaluated to determine key aspects of funding, operational best practices and equity framework. This paper provides examples of successful funding strategies from various programs in the U.S. that can be replicated or adapted in Louisiana.

Questions addressed include:

**Genesis of the funding source**
- What is the genesis of the funding source? Legislation?

**Characteristics of the funding source**
- Is the funding source recurring and from a consistent source?
- Did fees or taxes require authorization (and often regular reauthorization) by legislative bodies or the vote of the citizenry?
- Is there a mandated equity component?
- Is there an effective website, funding guide or portal?

**Applicability to Louisiana**
- Is the funding source applicable to Louisiana? If so, how?

RESULTS

**Geography and Population:**
Appendix A explores varied approaches side-by-side. The locations ranged widely in geographic scale and population. From small towns like Nashville, North Carolina, with a population of 5,500 in a 4.7-square mile land area, to large states like Texas with a population of 29 million and a land area of nearly 87,000-square miles, flood risk mitigation and best practices for watershed management are addressable at all scales from yards and neighborhoods to sprawling, multi-state efforts.

**Programs:**
Appendix A also shows that with variance in geography and population, programmatic efforts ranged widely (dependent on each state's particular issues and organizational structure), but generally included stormwater, nature-based solutions, green infrastructure, infrastructure, climate change adaptation, watersheds, water quantity and quality solutions, as well as holistic approaches, such as transportation and quality of life issues.
State and local governments are:

- Leveraging existing federal and state funding opportunities to build upon stormwater, NBS, GI, watershed, hazard mitigation and climate adaptation activities
- Using a nonprofit organization to coordinate funding and standards among watersheds in support of education and outreach efforts
- Financing through infrastructure banks to accelerate project, economic and workforce development
- Looking holistically at stormwater, NBS, GI, green spaces, public recreation, transportation and social equity
- Using sales taxes, property taxes and bonds to focus on environmental issues
- Establishing new user and impact fees as a means of on environmental issues
- Creating watershed-scale entities with jurisdiction over an entire watershed
- Investing in combinations of green and gray infrastructure
- Using funding received through carbon pricing to support solutions
- Assessing fees on commercial users of water resources to fund water management

The findings of this analysis include:

- The stability of long-term funding requires a mix of funding sources.
- The organization of flood mitigation programs occurs at different levels, from local to regional to state, and can be conducted by governmental, quasi-governmental or nonprofit organizations.
- Jurisdictions of vastly different sizes – geographically and in terms of populations – can implement stormwater, watershed and climate resilience programs.
- Most funding approaches require specialized legislation or a vote.
- Educating the citizenry and elected officials early in the process is necessary to gain support.

While no “silver bullet” or singular solution emerged, the options and approaches highlighted in this paper,
STRATEGIES FOR FUNDING WATERSHED MANAGEMENT AND FLOOD-RISK REDUCTION IN LOUISIANA

A Selection of Funding Strategies

All of the projects, initiatives and locations reviewed used a combination of funding strategies from federal and state programs and grants, to local budgets, fees and taxes, to investment by commercial and philanthropic entities. Funding mechanisms varied by location and were based on factors such as geography, history of flooding and natural disasters, population, urban density and other needs.

USER FEES

Louisiana is water-rich, but the state barely taps into this wealth. Water use is one of the easiest metrics to assess, predict and improve. Nationally, more than 82 billion gallons per day of freshwater are drawn from aquifers (NGWA, 2020). In Louisiana, the number is 1.7 billion gallons per day of groundwater and 6.7 billion from surface waters like the Mississippi River, mostly for energy and industrial production, and mostly at no cost (DOTD, 2015). In a 2020 report, Louisiana’s Management of Water Resources, the Legislative Auditor noted that a statewide water use plan, as proposed by numerous studies over the decades, is yet to be drafted (LLA, 2020).

Freshwater is freely extracted in most locations throughout the United States. Of the locations that do charge, fees vary widely, as do systems of measurement. For example, prices per acre-foot range from a dollar to more than $1,000 (NGWA, 2020). In California, at an average of $40 per acre-foot, the fee equates to $123 per million gallons (Baldocchi, 2018).

CAPITAL AREA GROUNDWATER COMMISSION

The six-parish Capital Area Groundwater Conservation Commission, administered within the Department of Natural Resources, is responsible for a user fee-based system that seeks to protect public water resources from over-extraction. Fees currently support research and policy development. Today, the Capital Area Groundwater Conservation Commission charges a fee of $20 per million gallons. In 2018, the fee was only $10 per million gallons and generated nearly six hundred thousand dollars that year (LLA, 2019). At the 2018 rate, potential revenue from all of Louisiana’s commercial water use would produce in the range of $30 million per year for the state (see Appendix B).
STORMWATER FEES

“Stormwater utility fees are generally the most effective means to ensure a stable, consistent revenue stream to implement a green infrastructure plan.” (EPA, 2014)

Stormwater utilities often use incentives for property owners to invest in green infrastructure (EPA, 2014).

TULSA, OK

7X0V DKDYLQJDSRSXODWLRLQVLPLODUWR1H2UOHDQVVXHUGDGHDO\0JRQRGLQ7ZHRUDVODWHU

the city enacted a stormwater fee and a phased implementation program for stormwater projects and

EX\HRXVWGLQHQLH\4HGLQKHLW\VDVLQGDQLQJ\PSQDQ7X0VDVVRUPZDHUHHLVDVHV\HG\DH\DPRQWL

per equivalency service unit, the projected annual cost of maintaining 2,650 square feet of property

(City of Tulsa, 2020). A residential property counts for one ESU per month per developed parcel. Fees for

multifamily, commercial and industrial properties are calculated as the number of ESUs, in total square feet.

NASHVILLE, TN

7RPHW\LVVLQ\DQGDQWLDHGV\WRUPZDHUH\UDVWXWUXH\HDWHTXDOLW\DQGSRPDQJ\HPQD

needs, the city of Nashville instituted a stormwater fee in 2017 (City of Nashville, 2020). The fee

generates about $34 million per year for the city of nearly 1.2 million (Garrison, 2017). While nationally,

stormwater fees generally range from $2 to $30 per typical residence, with a median of $6.67, Nashville is

slightly below the national median at $6.00 for a “typical” residential property. The program features several

creative incentives, such as a stormwater education credit (Metro Water Services, 2016).

NASHVILLE, NC

Demonstrating the applicability of stormwater fees throughout a wide range of jurisdictions, the town of

Nashville, with a population of about 5,000, approved an ad valorem stormwater fee in 2017 to fund storm

drain and ditch maintenance. The fee of $2.50 per month, or $30 per year per residential property, or $30

SHUVTXDUHIIHRILPSHUYLRXVXUIDFHUIRUQRHVLQHGWLODSURHUW\HQHUDWHDVSSUR\LPDWHO\1

per year for the municipality, supporting the development of a new stormwater division within the public

KXEVRLQQRYDWLQDGQNRZOHGHJ
In particular:

- The Stormwater Project Accelerator provides upfront capital for green stormwater infrastructure projects.
- The Municipal Resilience Program provides direct support to cities and towns to complete a municipal-driven process to connect climate change projections and local knowledge to identify and prioritize hazards, challenges and community strengths.

Since its inception in 1989, the bank has provided over $2.2 billion in financing and supported the creation of more than 62,000 jobs (RIIB, n.d.).

**Massachusetts**

Massachusetts passed a $2.4 billion environmental bond in 2018, which codified a 2016 executive order outlining a comprehensive approach to climate adaptation and funded it at $200 million (Commonwealth of Massachusetts, 2018). The bond includes funding for the Municipal Vulnerability Preparedness Program, which requires local governments to participate in a training course to develop integrated MVP and hazard mitigation plans, aligning language, data and goals throughout the state. Jurisdictions that participate in this training become eligible to apply for project implementation grants (Municipal Vulnerability Preparedness, n.d.).
RHODE ISLAND
In addition to the funding mechanisms described earlier, the Rhode Island Infrastructure Bank also issues green bonds. Since 2017, RIIB has issued more than $150 million in green bonds, ranging in value from less than $1 million to more than $33 million, funding 24 projects in numerous jurisdictions. Investments include capital projects aimed at water and climate resilience; replacement of water lines; pumping stations; water treatment plants; conversion of lighting and street lights to LED; and improvements and climate resilience of wastewater lines and facilities (RIIB, 2020).

LOUISIANA
In 2018, the Louisiana Community Development Authority participated in the state's first green bond (LCDA, 2018). Using funds from the state's share of the Gulf of Mexico Energy Security Act, the LCDA authorized nearly $12 million in funding for environmental infrastructure work to address shoreline erosion in Cameron Parish. The Louisiana Coastal Protection and Restoration Authority is currently studying the feasibility of green bonds to support wetland restoration (EDF, 2020).

NEW ORLEANS, LA
In 2020, the City of New Orleans and the Finance Authority of New Orleans were awarded assistance from the Mississippi River Cities and Towns Initiative to study environmental impact bonds to support green infrastructure. Projected revenue from the bonds is $30 million. One aspect of the bond funds is to allow the city to offer green mortgages to homeowners and developers that require installation of measures that manage stormwater. Additionally, the city plans to create a pool of capital for other resilience projects that Louisiana WATERSHED MANAGEMENT AND FLOOD-RISK REDUCTION IN LOUISIANA

CARBON PRICING/TRADING MARKETS
Carbon pricing is an approach to reducing carbon dioxide emissions, or greenhouse gases, by using market mechanisms to pass the cost of emitting on to emitters as “polluter pays.” The broad goal is to discourage the use of carbon dioxide–emitting fossil fuels (Carbon Pricing Leadership Coalition, 2018). Carbon markets are mature, growing, templated, collaborative and revenue-ready; states simply join, systems activate and dollars flow. As a state hosting a significant number of international carbon and water intense industries, many of which are already shifting to meet carbon-neutral goals, Louisiana is positioned to benefit significantly from participation in carbon markets. Funds from these markets serve a broad range of needs, including watershed management and flood risk reduction.

A first-day executive order by the Biden Administration, followed by a memorandum to all federal executive departments and agencies, set new carbon policies and baseline pricing of $51 per ton of carbon dioxide for the determination of climate impacts of all federal activities. This new pricing policy is intended to encourage reductions in greenhouse gas emissions across all sectors of the economy, including transportation, agriculture, and manufacturing.

VIRGINIA
In July 2020, Virginia enacted the Community Flood Preparedness Fund as part of the Clean Energy and Community Flood Preparedness Act under its Department of Conservation and Recreation. Under the act, 45% of revenues from the sale of Regional Greenhouse Gas Initiative carbon allowances accrue to the fund. These funds are used to support local and regional efforts to prepare for and mitigate the impacts of flooding and other climate-related hazards. The fund has already supported a variety of projects, including the construction of floodwalls, the installation of pump systems, and the implementation of community resilience plans.

LOUISIANA WATERSHED INITIATIVE
LOUISIANA

In 2017, the Louisiana Legislature passed HB423 authorizing the Louisiana Department of Environmental Quality to establish and administer a water quality trading program. Water users with “high costs of reducing pollution can purchase equal or greater pollution reductions from sources with lower costs (LDEQ, n.d.). A mix of stakeholders are actively developing the program, which is yet to generate funds (LDEQ, 2019).

In August 2020, in an effort to achieve zero emissions by 2050, Governor John Bel Edwards signed Executive Order JBE 2020-18 to launch a Climate Initiatives Task Force of experts and stakeholders to identify ways to reduce greenhouse gas emissions and identify carbon management strategies that support integrated coastal management and adaptation.

PROPERTY TAXES / MILLAGE

Some communities find a successful, recurring source of revenue to be a property tax, or millage, dedicated to funding water quantity and quality issues within jurisdictional boundaries. A challenge is that tax-exempt entities, such as properties owned by churches, schools and local governments can be exempt even though they may contribute significantly to runoff.

BAYOU VERMILION DISTRICT

The Lafayette Parish Bayou Vermilion District serves as an established example of a Louisiana entity focused on watershed management. BVD is authorized to generate revenue through property taxes to manage and maintain water quality and offer public outreach and education (LA Act 161, 1984). The District is funded primarily through a 10-year .75 mil property tax assessment, which has been consistently renewed at the ballot box, most recently in 2017 by 57% of voters (Gastinell, 2017) and which generated more than $2.1 million in 2019 (Wright et al., 2020). Notably, BVD supplements tax revenue with recreation/tourism revenue and leverages educational outreach to build awareness and support for water quality improvement projects, economic development and watershed management.

SALES TAX

Many cities and parishes have the authority to enact a local sales tax if approved by voters. However, governments and stakeholders have to educate the public about the importance of the tax if it is to pass. A community will only vote to approve a tax if they understand the value of it.

ST. PETERS, MO

St. Peters, Missouri, passed two sales tax initiatives to fund stormwater projects and parks. The first passed in 2000 and raised the sales tax one-tenth of a cent, which was used to develop several well-promoted public projects and as 50/50 match funds for projects on private property. The second passed in 2012 with 68% of the vote, and added four-tenths of a cent (City of St. Peters, n.d.). Raising the sales tax was seen as the preferred, least-cost alternative over property tax or a stormwater fee for generating revenue to support bond issues, allowing the city to draw revenue from visitors as well as residents.
Other Management Strategies

COMMUNITY-BASED PUBLIC-PRIVATE PARTNERSHIPS

The CBP3 model invests in green infrastructure approaches that provide for local economic growth and improved quality of life in urban and underserved communities. Through the CBP3 model, local government investment in green infrastructure approaches that provide for local economic growth and improved quality of life in urban and underserved communities. Through the CBP3 model, local government partners with a private entity to provide flexibility and access to advanced technology, address community development goals and encourage long-term financial support for integrating green infrastructure into stormwater programs (EPA, n.d.).

MILWAUKEE, WI

In 2019, the Milwaukee Metropolitan Sewerage District released a request for proposals to identify a private partner to develop 20 million gallons of green infrastructure-based stormwater capture projects over three years (MMSD, 2020). Corvias, the company selected, finances projects upfront and is paid based on the number of gallons captured. The partnership allows the agency to accelerate the pace of implementation and to achieve economies of scale compared to distributed, project-by-project contracting and construction.

MITIGATION BANKS AND LAND TRUSTS

Investments in mitigation banks and land trusts grow organically and financially. Mitigation banks are a land-based trading system in which unavoidable damages to natural wetlands are offset by investing in the restoration or preservation of another site’s wetland habitats, usually on the same or nearby watershed (Wood, 2018). Mitigation banks create permanent conservation easements that protect specific natural functions of the land in perpetuity.

A land trust is a charitable organization that acquires and manages land for a range of conservation purposes (We Conserve CPA, n.d.). Land trusts offer partnership and fundraising opportunities to align and leverage dollars and systems, and whether created to serve a region or the state, provide another vehicle for conservation easements.

Louisiana is home to many mitigation banks and land trust projects actively working to restore watersheds, floodplains, streams and marshes. Though not a traditional funding source, mitigation banks can help leverage and connect partners, affect significant tracts of land and generate numerous co-benefits and long-term management opportunities. Land trusts can often provide matching capital, in-kind resources and corporate and philanthropic partnerships that leverage funds to achieve regional watershed and flood risk management goals.
RED CHUTE MITIGATION BANK, BOSSIER PARISH, LA

This mitigation bank focuses on the restoration of more than nine hundred acres of bottomland hardwood wetlands on the Red River to re-establish natural functions, restore habitat and return the floodplain to its original roles (RES, n.d.).

CANE BAYOU MITIGATION BANK, ST. TAMMANY PARISH, LA

Using an opportunity to leverage mitigation credits purchased from out-of-state companies, St. Tammany Parish will restore and protect 1,169 acres of land in the headwaters of Cane Bayou. The parish expects the project to generate opportunities to trade the credits at rates considerably higher than the purchase costs. (STPG, n.d.).

LAND TRUST FOR LOUISIANA

The Land Trust for Louisiana concentrates on four types of conservation: forest and natural areas, agricultural lands, freshwater and coastal resources and urban green space, offering a flexible range of potential opportunities for regional watershed managers. The organization currently manages 20 conservation projects on more than 7,000 acres spread across southeast Louisiana.

BROWNFIELDS PROGRAM

LDEQ manages the Brownfields Program, which provides support and funding for remediating and repurposing vacant industrial or commercial sites into productive use that returns properties to tax rolls. Often used as part of the mix of funding and partners in the development of commercial projects, the program can also be used to support parks and sites that showcase risk reduction and water management best practices.

USING TRANSPORTATION FUNDING TO MAXIMIZE STORMWATER CO-BENEFITS

GREAT ER M EMPHIS, TN METROPOLITAN AREA

Greater Memphis, TN Metropolitan Area

The Mid-South Regional Greenprint was created to effectively combine multiple sources of federal, state and local funding – including transportation funding for recreational trails – to implement a regional plan for trails and open space to mitigate flooding and promote community growth. In the Greenprint, the greater Memphis region (including portions of Tennessee, Mississippi and Arkansas) holistically addresses flooding, green space, recreation opportunities, employment centers and the transportation network while prioritizing social equity (LRK Inc. et al, 2014).

HAZARD-RESISTANT BUILDING AND DEVELOPMENT CODES

Statewide consistency in development standards offers a proven way to achieve long-term cost savings and risk reduction. The rise of flood risk ratings in the insurance, real estate, and banking industries makes the risks faced by owners of commercial and residential real estate more transparent. In October 2021,
In 2020, FEMA released *Building Codes Save: A Nationwide Study* which determined that "modern building codes lead to a major reduction in property losses from natural disasters" (FEMA, 2020). According to FEMA and the National Institute of Building Sciences, designing buildings to meet the 2018 International Residential Code and 2018 International Building Code "led to a national benefit of $11 saved for every dollar invested in comparison to older generations of code" (FEMA, n.d.).

Adopting higher building standards only reduces risk for newly constructed buildings or buildings with significant renovations that require upgrading to the new building code. For existing buildings, communities can incentivize property owners to retrofit properties to reduce their risk. Revolving loan funds, grants and other mechanisms can equitably invest in reducing collective risk and protect future revenue streams. Hazard-resistant building codes protect people and property, saving money through reduced insurance premiums and avoiding future costs of mitigation and recovery. They also stabilize the financial future of homeowners and communities as resilient properties built to higher standards are more likely to withstand disasters and appreciate in value.

**NON-PROFIT COORDINATION OF WATERSHED AND STORMWATER INTERESTS**

A statewide gap analysis revealed that no existing public entities currently have the full range of multijurisdictional authority and responsibilities needed to administer regional watershed management and flood-risk reduction (LWI, 2018). Additionally, some entities have overlapping authority and geographic jurisdictional responsibilities to administer regional watershed management (LWI, 2020). In some states, nonprofit organizations assume various stormwater and watershed responsibilities and serve as hubs for planning, design standards, community education, economic and workforce development and timely information on funding opportunities.

**NEW JERSEY**

In 2019, New Jersey passed NJ S1073, which authorizes counties and municipalities to establish and operate stormwater utilities. In response to this law and in recognition of the need to quickly increase local capacity to take advantage of it, New Jersey Future, a statewide, nonprofit focused on growth, development and infrastructure, partnered with Flood Defense New Jersey, a coalition of state and local nonprofit organizations organized around flood and pollution mitigation. Together, they took a lead role in stormwater management through the New Jersey Stormwater Utility Resource Center to support local governments in creating stormwater utilities (SURC, n.d.).
Flood-Ready = Fund-Ready

Aspiring to be flood-ready has the power to drive positive actions connecting the environmental, social and economic fabrics of Louisiana. Flood-ready infrastructure, jobs, buildings, agriculture, transportation, communications and response services are just some of the areas in which the state can build new socio-economic strengths. Aligning regional academic, business, government and nonprofit efforts to identify and nurture innovative solutions for what it means to be flood-ready offers transformative economic opportunities found in Louisiana’s water economy potential.

Regional managers face distinct challenges to be fund-ready within the context of the many funding opportunities available. Requirements for public and private funding sources require regions to possess legal authorities and organizational capacities. In the digital age, funding preparedness involves building capacity and expertise within reach of every community. Web-based applications and resources offer open access to funds and supportive tools and resources to guide novice users, creating new opportunities for watershed and flood risk managers. Being fund-ready also means being discoverable by systems seeking to support watersheds, flood risk mitigation and nature-based solutions.

## PREPARE FOR FUNDING

### Align with international terminology, data, and metrics

- Focus on local and regional economic and adaptation opportunities in every action whether planning, mitigation, response, or recovery and build capacities to generate revenue, nurture innovation, encourage entrepreneurship and build the workforce of the future.

### Natural Capital: Assets that Grow

Natural capital is an economic term to describe all the natural components of the planet: air, soil, water, biodiversity, biomimicry, regenerative design, and ecosystem services. It is increasingly recognized that environmental and economic needs will require the development of new tools to protect and enhance natural capital. Infrastructure planning terms relating to natural capital include nature-based solutions, green infrastructure, biodiversity, biomimicry, regenerative design, and ecosystem services. These tools support consistency in how plans are developed and decided upon. When done successfully, projects naturally grow over time and improve the quality of life.
Nature-based solutions and green infrastructure represent an evolution of how humans develop and adapt design of hard, or “gray” infrastructure, to enhance the performance of infrastructure such as transportation destructively with natural systems. NBS and GI are increasingly driving design as environmental standards within organizations such as the U.S. Army Corps of Engineers, whose Engineering with Nature initiative offers valuable guidance. NBS and GI can be interchangeable terms, and each may be specified in contracts and design codes and principles.

The Circular Economy

A global movement is underway to transform our linear, take-make-waste economy into a systems-oriented, circular economy. Most of the world’s largest corporations, along with a growing number of countries, are reimagining how humanity, the planet and economies can thrive. As noted by the Ellen MacArthur Foundation, a circular economy is:

- A systemic approach to economic development designed to benefit businesses, society, and the environment
- Restorative and regenerative by design
- Keeps products and materials in use and designs out waste and pollution

The pursuit of circular principles leads to innovation as managers rethink water systems and infrastructure to be more efficient and in harmony with natural systems. From multijurisdictional sharing of resources, personnel and equipment to digital technologies for real-time monitoring to closed-loop wastewater systems that generate energy, nutrients and clean water, the shift to the circular economy is underway globally (Jeffreys and Fall, 2020).

Including circular economy principles in regional watershed management decision-making offers a chance to nurture innovation, collaboration and modern efficiencies in the design and construction of local projects, creating business opportunities and new sources of long-term revenue.

Mollicy Farms Floodplain Restoration Project, Credit: Nature Conservancy.
THE LOUISIANA WATER ECONOMY

Seven economic sectors constitute Louisiana’s water economy, encompassing all economic and social activities in which water is an important and/or dominant factor, and in which Louisiana’s relative water wealth and abundance—whether for “good,” or as is the case with costly surge, flood, and disaster management, for “bad”—contributes to the existence of the sector, resource, or activity (Picou and Mendoza, 2017).

The seven sectors: agriculture and fisheries, coast and environment, ecotourism and recreation, energy and industry, law and policy, maritime and ports, and water infrastructure are the foundation of Louisiana’s quality of life and economy. Each sector is impacted by flooding, and each can, and should, participate in developing risk reduction and funding opportunities. Identifying and including stakeholders from the seven sectors in shaping and supporting Louisiana’s watershed vision is a key piece of the funding puzzle.

All Louisiana water economy sectors feature water-centric circular economy opportunities, with ongoing or developing programs in agriculture, municipal infrastructure, energy, and industry, law and policy, maritime and ports, ecotourism and recreation, and coast and environment (Picou and Mendoza, 2017).
Conclusion

Louisiana is water wealthy, and water is everybody’s business. Long-term and effective funding of public service activities in water management ultimately depend upon a change in how we value water and watersheds and upon our ability to adapt and improve organizational and governance structures.

In the past, our hubris caused us to take water for granted. Lulled by its abundance, we fail to appreciate water’s fragility and power or to place value to its large-scale use. Two challenges are at the heart of gaps in our funding mechanisms and stewardship of this precious resource: the ability to measure and value water’s use and to recognize and learn to live with water’s cycles and roles.

**Recurring/Consistent?**
- Yes | Yes | Yes |

**Operational Best Practices**
- Has a Texas Water Plan, finance board, innovation center, and recently initiated river basin flood management system similar to LWI. Legislatively directed to finance $27 billion in the state's Water Plan projects over the next 50 years. | Successful implementation of stormwater fees in combination with other local and federal sources and buyouts | Using funding through carbon pricing to fund stormwater and climate resilience projects, with an emphasis on low income areas. |

**Applicable to LA**
- Mirroring LWI with recently launched regional approach to watershed management. Includes strong economic development and innovation programming. | <HV OR V WFRPPRQ01XVHGIXQGLO|mechanism. Abundant resources available for model codes and education/outreach. | Carbon pricing revenue aligns with Gov. (GZDUGV & OLDPWHQLWLDWLYHV7DVN)RUHF priorities. |

Appendix B: Water Use Potential Revenue Table

2015 COMMERCIAL WATER USE IN LOUISIANA

POTENTIAL REVENUE EXAMPLE

This table applies an overview of water use and withdrawals in Louisiana to calculate possible revenue. The Withdrawal Sectors aggregate household/human consumption uses, and two commercial and industrial and power generation. The HSHUPLQWDOIRQHDOORQH[DPSOHLVEDVHGURQ the 2018 rate for water withdrawals in the Capital Area, which recently was raised to $20 PMG.

If the State of Louisiana charged a consistently applied fee of $10 PMG for annual revenue is possible. Of note is that
